LCTES, 12<sup>th</sup> June, 2014

# Summary

- 1 Standard Approach : imprecise
- 2 Precise BUT Inefficient
- 3 Precise AND Efficient

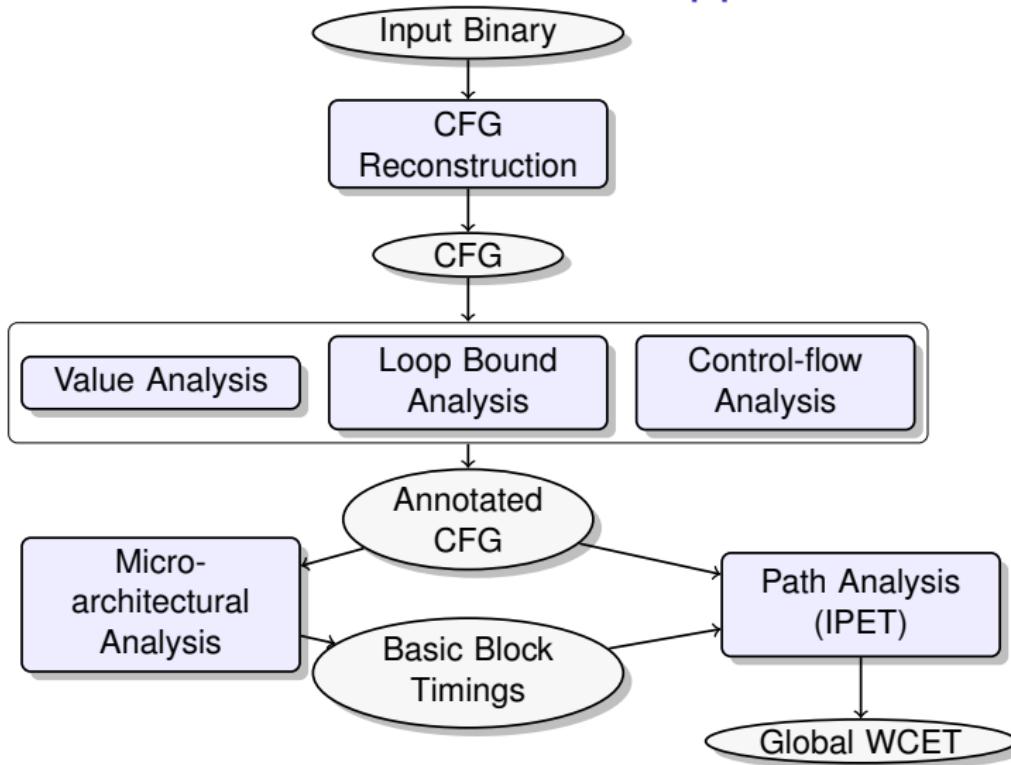

# Summary

1 Standard Approach : imprecise

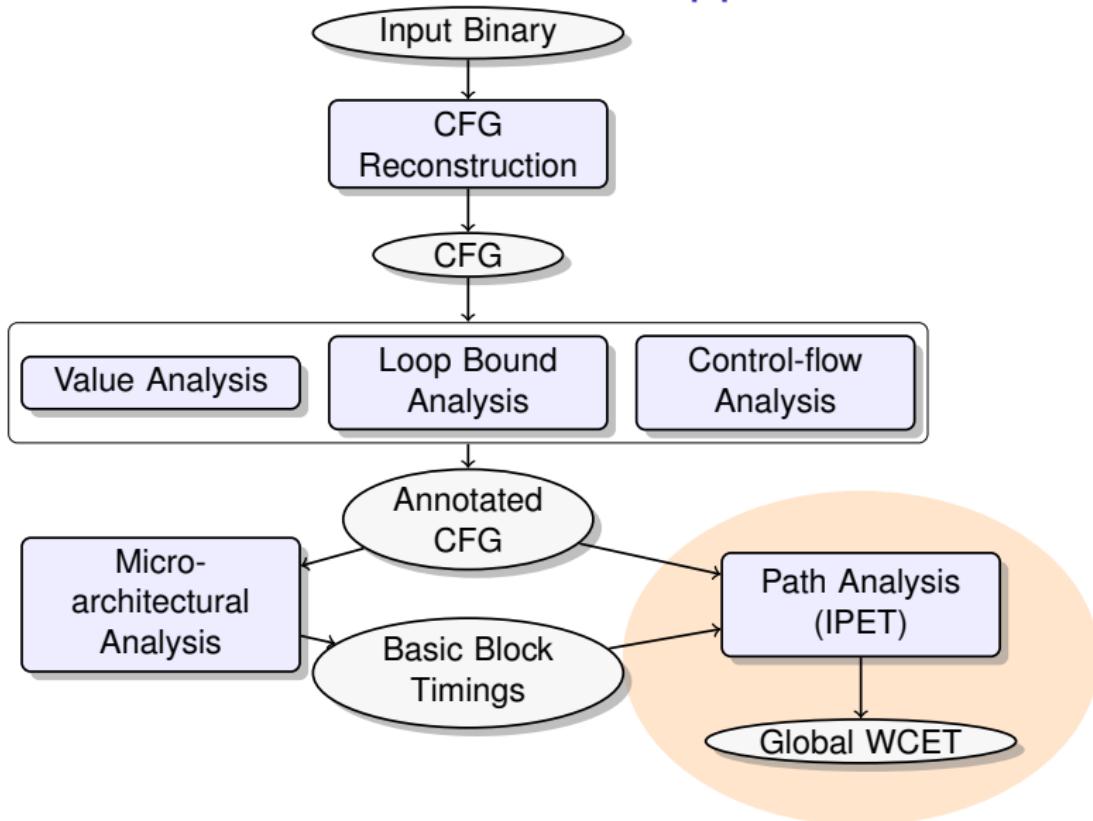

2 Precise BUT Inefficient

3 Precise AND Efficient

# WCET: Standard Approach

# WCET: Standard Approach

# WCET: Standard Approach using ILP

**Input:**

- CFG of the program
- Basic Blocks timing upper bounds

**Output:** WCET for the entire CFG

→ Integer Linear Programming (ILP) problem.

ILP constraints encode:

- control structure
- possibly some infeasible paths :  
“if transition T1 is taken then T2 is not”

# WCET: Standard Approach using ILP

## Input:

- CFG of the program
- Basic Blocks timing upper bounds

Output: WCET for the entire CFG

→ Integer Linear Programming (ILP) problem.

ILP constraints encode:

- control structure
- possibly some infeasible paths :  
“if transition T1 is taken then T2 is not”

## Problem

**Imprecise:** Worst-case path may be infeasible

# Reactive Control Systems

```
void rate_limiter_step() {  
    assume (x_old <= 10000);  
    assume (x_old >= -10000);  
    x = input(-10000,10000);  
    if (x > x_old+10)  
        x = x_old+10;  
    if (x < x_old-10)  
        x = x_old-10;  
    x_old = x;  
}  
  
void main() {  
    while (1)  
        rate_limiter_step();  
}
```

1 “big” infinite loop

~ Loop-free body

Goal: WCET for 1 loop iteration < some bound

# Summary

1 Standard Approach : imprecise

2 Precise BUT Inefficient

3 Precise AND Efficient

## Our Method

Replace ILP by **Satisfiability Modulo Theory**

**Why?** Expressivity : detects every semantically infeasible paths

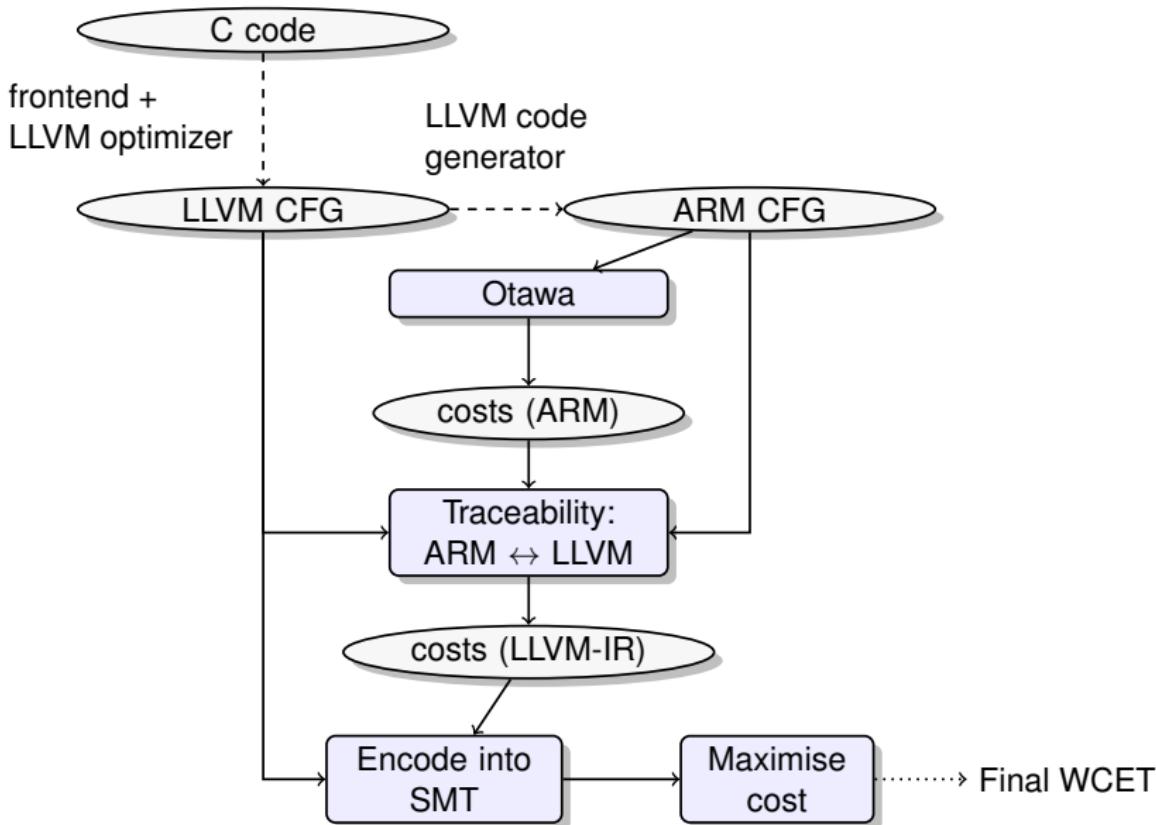

**Input:**

- **Loop-free** CFG of the program
- Basic Blocks timings (e.g. given by OTAWA)

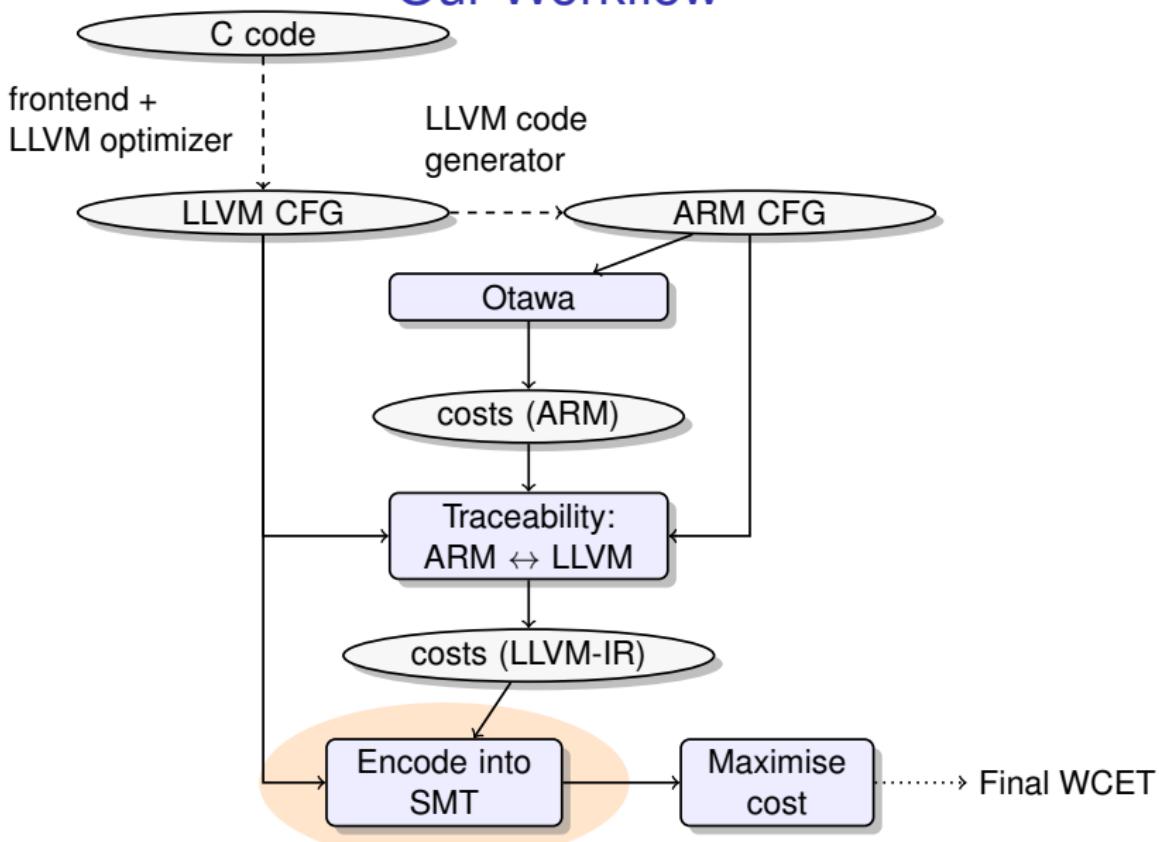

**Output:**

- WCET for the entire CFG + Worst Case path

# Our Workflow

# Our Workflow

# Satisfiability Modulo Theory

Boolean Satisfiability (SAT):

$$b_1 \wedge ((b_2 \wedge b_3) \vee (b_4))$$

# Satisfiability Modulo Theory

Boolean Satisfiability (SAT):

$$\begin{aligned} & b_1 \wedge (( b_2 \wedge b_3 ) \vee ( b_4 )) \\ & x \geq 0 \wedge (( y \geq x + 10 \wedge y \leq 0 ) \vee ( x + 1 \geq 0 )) \end{aligned}$$

Modulo Theory: Atoms are elements from a given decidable theory

e.g. Linear Integer Arithmetic (LIA)

SMT solvers typically combine a SAT solver + Theory solver

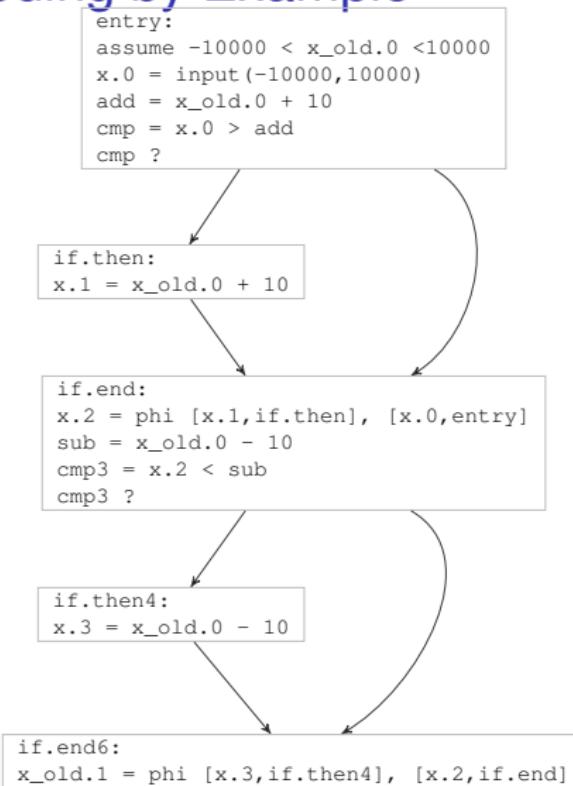

# SMT Encoding by Example

```

void rate_limiter_step() {
    assume (x_old <= 10000);
    assume (x_old >= -10000);
    x = input(-10000,10000);
    if (x > x_old+10)
        x = x_old+10;
    if (x < x_old-10)
        x = x_old-10;
    x_old = x;
}

void main() {
    while (1)
        rate_limiter_step();
}

```

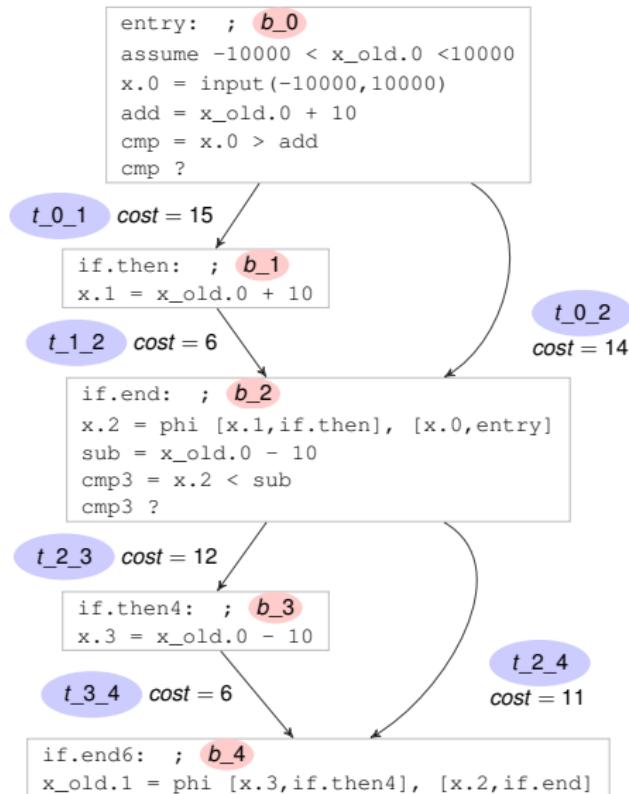

LLVM Control Flow Graph

The SMT formula encodes the feasible program traces:

- 1 Boolean per block
- 1 Boolean per transition

$b_i \text{ true} \leftrightarrow \text{trace goes through } b_i$

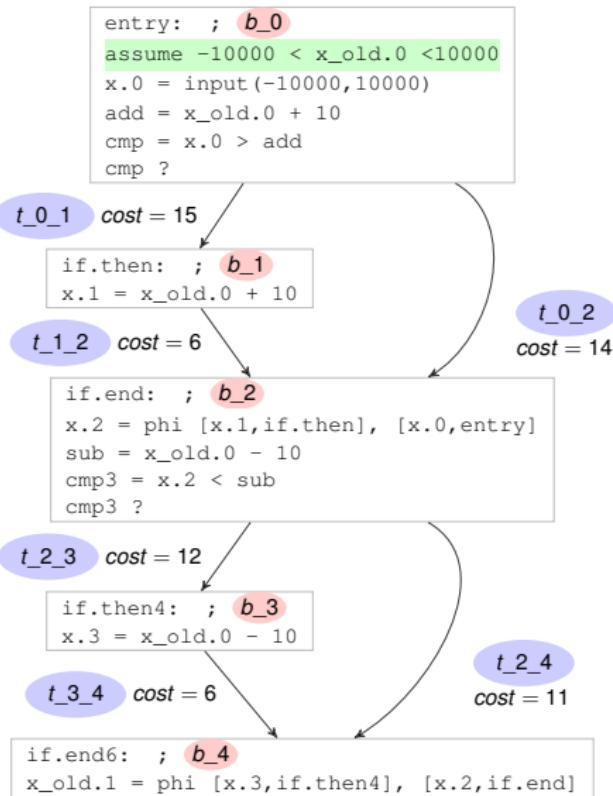

Cost for the trace:  $\sum b_i * cost_i$

## Step 1: encode instructions (Linear Integer Arithmetic)

Static Single Assignment form:  
1 SMT variable  $\leftrightarrow$  1 SSA variable

- $-10000 \leq x\_old.0 \leq 10000$
- $\wedge -10000 \leq x.0 \leq 10000$
- $\wedge add = (x\_old.0 + 10)$
- $\wedge x.1 = (x\_old.0 + 10)$
- $\wedge sub = (x\_old.0 - 10)$
- $\wedge x.3 = (x\_old.0 - 10)$
- $\wedge b_2 \Rightarrow (x.2 = ite(t_{1\_2}, x.1, x.0))$
- $\wedge b_4 \Rightarrow (x.1 = ite(t_{3\_4}, x.3, x.2))$

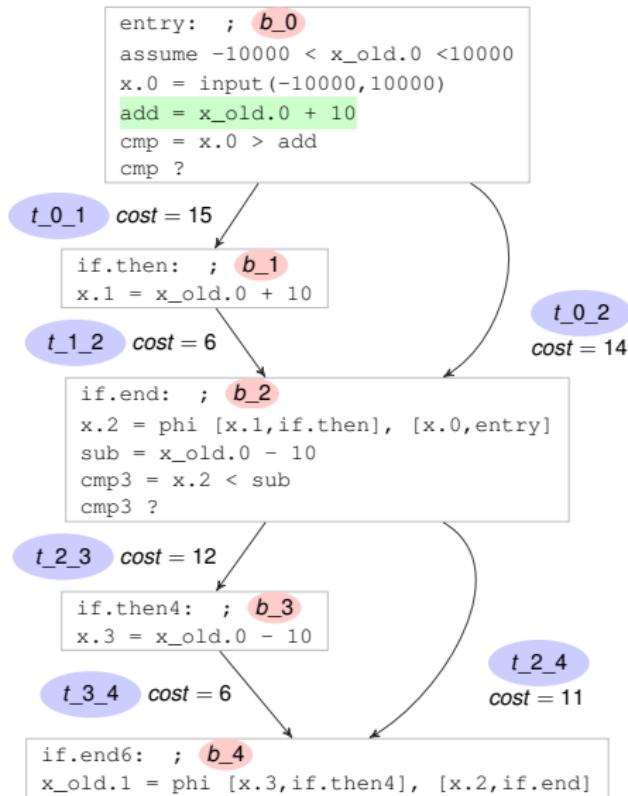

## Step 1: encode instructions (Linear Integer Arithmetic)

Static Single Assignment form:

1 SMT variable  $\leftrightarrow$  1 SSA variable

- $-10000 \leq x\_old.0 \leq 10000$
- $\wedge -10000 \leq x.0 \leq 10000$
- $\wedge add = (x\_old.0 + 10)$
- $\wedge x.1 = (x\_old.0 + 10)$
- $\wedge sub = (x\_old.0 - 10)$
- $\wedge x.3 = (x\_old.0 - 10)$
- $\wedge b_2 \Rightarrow (x.2 = ite(t_{1\_2}, x.1, x.0))$
- $\wedge b_4 \Rightarrow (x.1 = ite(t_{3\_4}, x.3, x.2))$

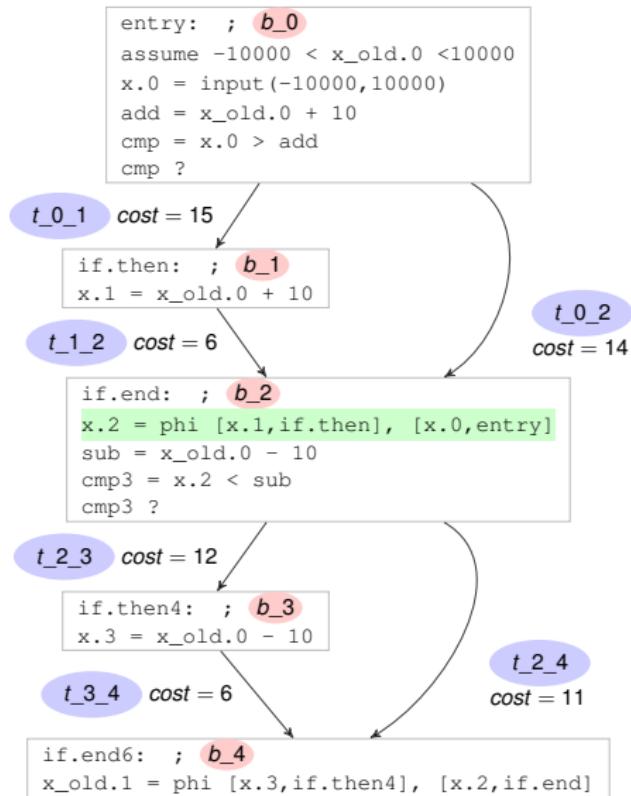

## Step 1: encode instructions (Linear Integer Arithmetic)

Static Single Assignment form:

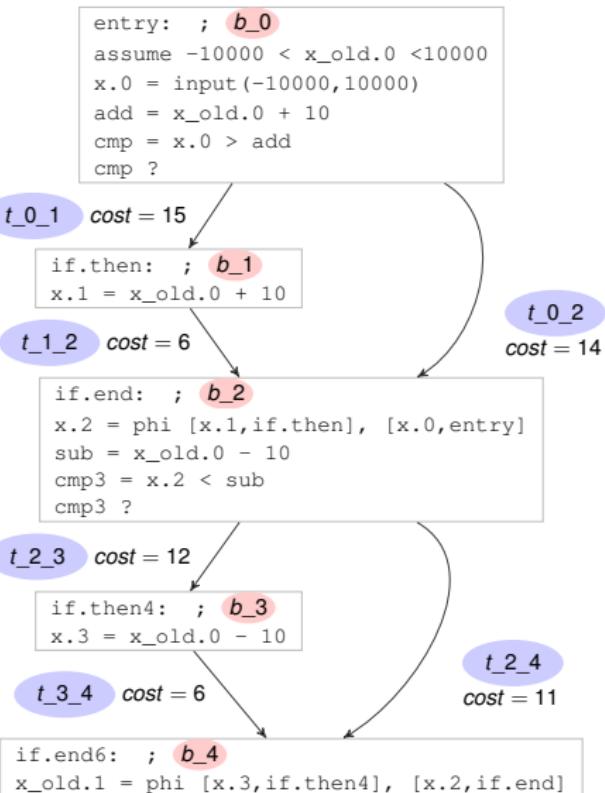

1 SMT variable  $\leftrightarrow$  1 SSA variable

- $-10000 \leq x\_old.0 \leq 10000$
- $\wedge -10000 \leq x.0 \leq 10000$
- $\wedge add = (x\_old.0 + 10)$
- $\wedge x.1 = (x\_old.0 + 10)$
- $\wedge sub = (x\_old.0 - 10)$
- $\wedge x.3 = (x\_old.0 - 10)$
- $\wedge b_2 \Rightarrow (x.2 = ite(t_1_2, x.1, x.0))$
- $\wedge b_4 \Rightarrow (x.1 = ite(t_3_4, x.3, x.2))$

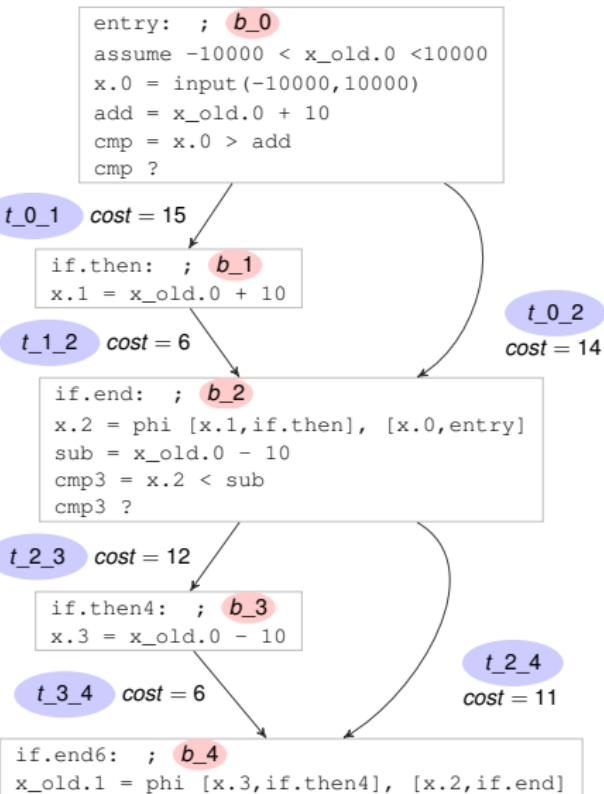

## Step 2: encode control flow (Very similar to ILP)

$\wedge \quad b_0 = b_4 = \text{true}$   
 $\wedge \quad b_1 = t_{0\_1}$   
 $\wedge \quad b_2 = (t_{0\_2} \vee t_{1\_2})$   
 $\wedge \quad \vdots$   
 $\wedge \quad \vdots$   
 $\wedge \quad t_{0\_1} = (b_0 \wedge (x.0 > \text{add}))$   
 $\wedge \quad \vdots$   
 $\wedge \quad \vdots$

## Step 3: encode timings

- $\wedge \quad c_{0\_1} = (\text{if}(t_{0\_1}) \text{ then } 15 \text{ else } 0)$
- $\wedge \quad c_{0\_2} = (\text{if}(t_{0\_2}) \text{ then } 14 \text{ else } 0)$
- $\wedge \quad \vdots$
- $\wedge \quad \vdots$
- $\wedge \quad \vdots$
- $\wedge \quad \vdots$
- $\wedge \quad cost = (c_{0\_1} + c_{0\_2} + c_{1\_2}$   
 $\quad \quad \quad + c_{2\_3} + c_{2\_4} + c_{3\_4})$

# 1 satisfying assignment

↔ 1 program trace:

$b_0 = b_1 = b_2 = b_4 = \text{true}$

$b_3 = \text{false}$

$t_{0\_1} = t_{1\_2} = t_{2\_4} = \text{true}$

$t_{0\_2} = t_{2\_3} = t_{3\_4} = \text{false}$

$x_{\text{old}.0} = 50$

$x.0 = 61$

$\text{add} = 60$

$x.1 = 60$

$x.2 = 60$

$\text{sub} = 40$

**cost = 32**

```
entry: ; b_0
assume -10000 < x_old.0 < 10000
x.0 = input(-10000,10000)
add = x_old.0 + 10
cmp = x.0 > add
cmp ?
```

$t_{0\_1}$  cost = 15

```
if.then: ; b_1
x.1 = x_old.0 + 10
```

$t_{1\_2}$  cost = 6

```
if.end: ; b_2
x.2 = phi [x.1,if.then], [x.0,entry]
sub = x_old.0 - 10
cmp3 = x.2 < sub
cmp3 ?
```

$t_{2\_3}$  cost = 12

```
if.then4: ; b_3
x.3 = x_old.0 - 10
```

$t_{3\_4}$  cost = 6

```
if.end6: ; b_4
x_old.1 = phi [x.3,if.then4], [x.2,if.end]
```

$t_{0\_2}$  cost = 14

$t_{2\_4}$  cost = 11

# 1 satisfying assignment

↔ 1 program trace:

$b_0 = b_1 = b_2 = b_4 = \text{true}$

$b_3 = \text{false}$

$t_{0\_1} = t_{1\_2} = t_{2\_4} = \text{true}$

$t_{0\_2} = t_{2\_3} = t_{3\_4} = \text{false}$

$x_{\text{old}.0} = 50$

$x.0 = 61$

$\text{add} = 60$

$x.1 = 60$

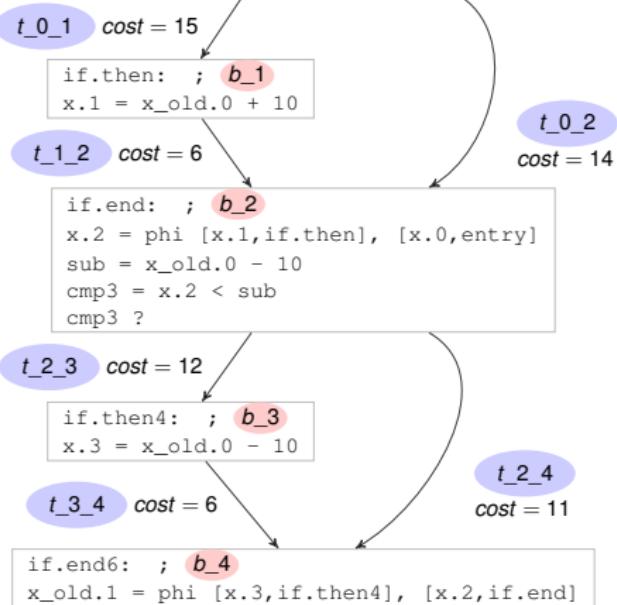

$x.2 = 60$

$\text{sub} = 40$

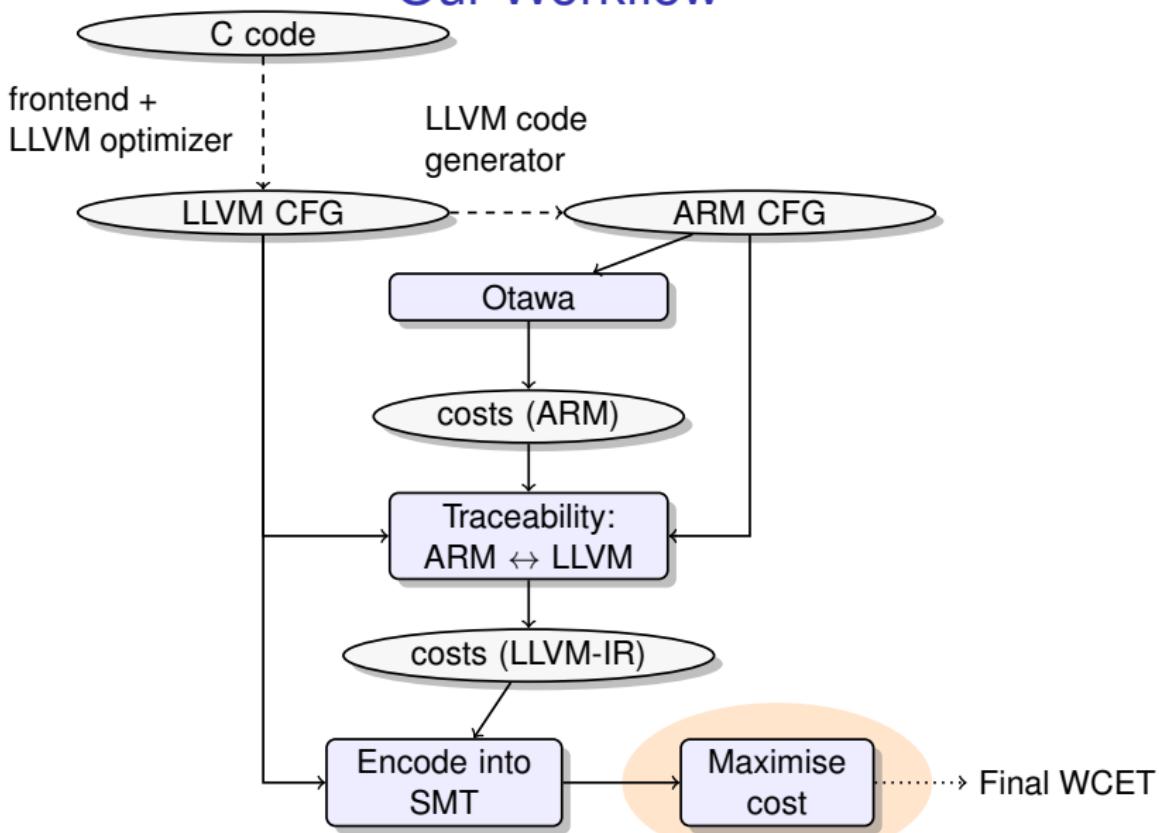

**cost = 32**

We want the trace with the highest cost

```
entry: ; b_0
assume -10000 < x_old.0 < 10000
x.0 = input(-10000,10000)
add = x_old.0 + 10
cmp = x.0 > add
cmp ?
```

# Our Workflow

# Computing the WCET

## Optimization modulo Theory:

We search for the trace maximizing the variable *cost*.

Using any off-the-shelf SMT solver

Dichotomy strategy (with incremental solving):

Maintain an interval containing the WCET

- Initial interval [0, 100]

# A Really Simple Example

$b_1, \dots, b_n$  unconstrained Booleans

```
if (b1) { /* timing = 2 */ } else { /* timing = 3 */ }
if (b1) { /* timing = 3 */ } else { /* timing = 2 */ }
...
if (bn) { /* timing = 2 */ } else { /* timing = 3 */ }
if (bn) { /* timing = 3 */ } else { /* timing = 2 */ }
```

**Basic IPET would find WCET <= (3+3)n = 6n**

“Obviously” all traces take time  $(3 + 2)n = 5n$ .

# A Really Simple Example

$b_1, \dots, b_n$  unconstrained Booleans

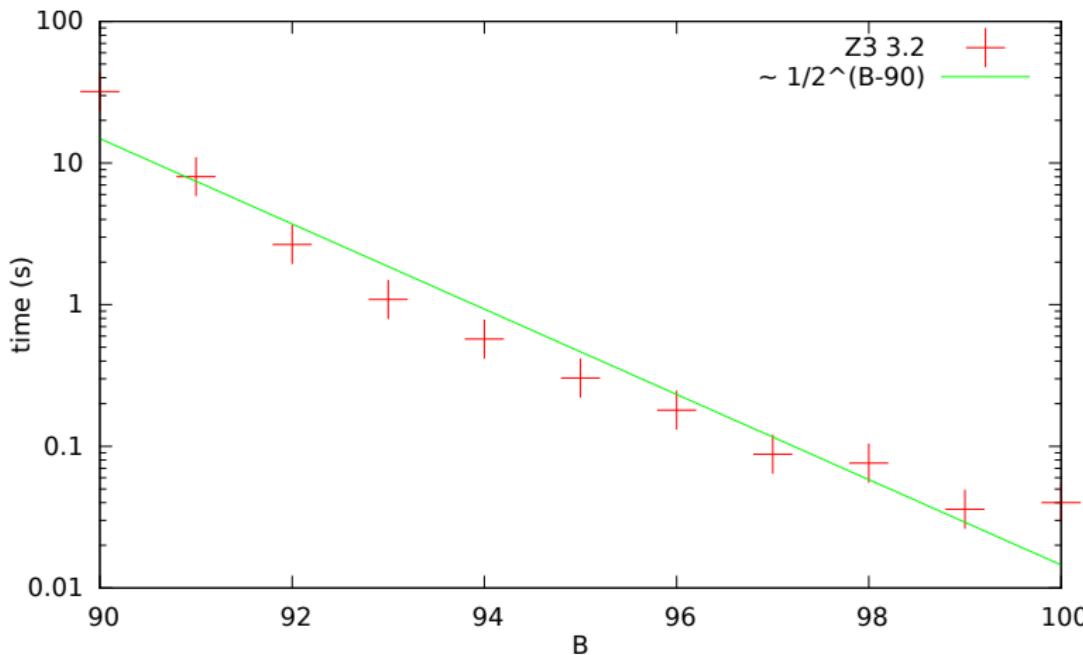

```
if (b1) { /* timing = 2 */ } else { /* timing = 3 */ }
if (b1) { /* timing = 3 */ } else { /* timing = 2 */ }
...
if (bn) { /* timing = 2 */ } else { /* timing = 3 */ }
if (bn) { /* timing = 3 */ } else { /* timing = 2 */ }
```

**Basic IPET would find WCET  $\leq (3+3)n = 6n$**

“Obviously” all traces take time  $(3 + 2)n = 5n$ .

**SMT approach will find  $5n$ , but in a few months...**

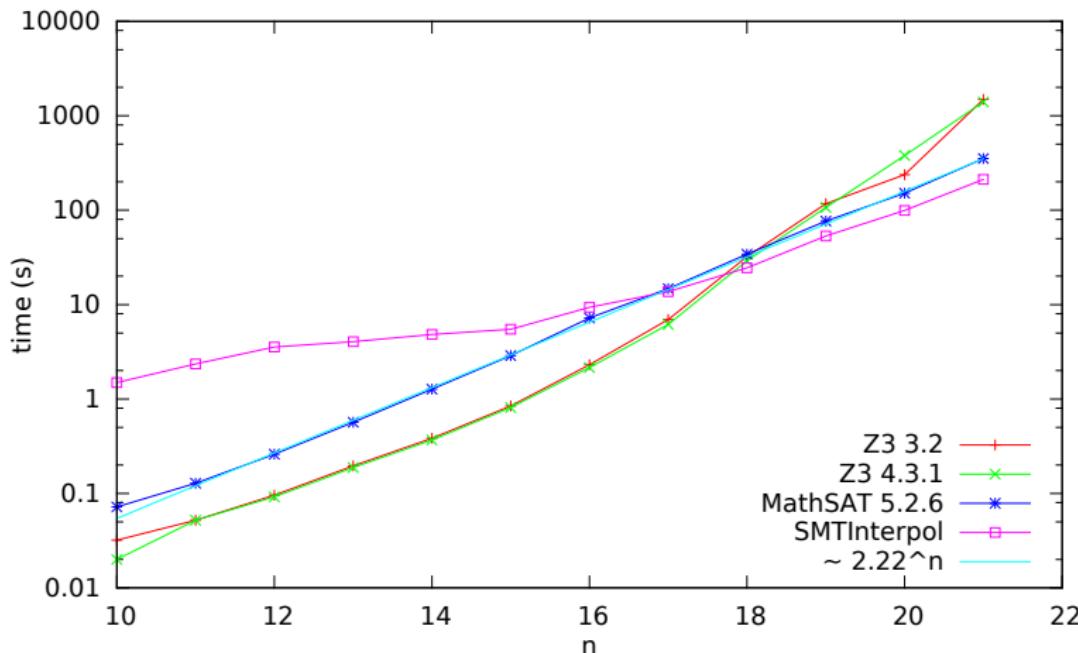

# Binary search, $n = 18$ , WCET = 90

Cost grows exponentially close to the optimum 90.

# Proving optimality is costly

Proving that there is no trace longer than  $5n$

Cost **exponential** in  $n$  ( $2^n$  paths)

## Why such high cost?

Formula we try to solve:

$$\begin{aligned} & (b_1 \Rightarrow x_1 = 2) \wedge (\neg b_1 \Rightarrow x_1 = 3) \wedge (b_1 \Rightarrow y_1 = 3) \wedge (\neg b_1 \Rightarrow y_1 = 2) \wedge \\ & \cdots \wedge \\ & (b_n \Rightarrow x_n = 2) \wedge (\neg b_n \Rightarrow x_n = 3) \wedge (b_n \Rightarrow y_n = 3) \wedge (\neg b_n \Rightarrow y_n = 2) \wedge \\ & x_1 + y_1 + \cdots + x_n + y_n > 5n \end{aligned}$$

All production grade SMT-solver are based on “DPLL( $\mathcal{T}$ )”:

- enumerate a Boolean choice tree over  $b_1, \dots, b_n$
- cut branches when encountering **inconsistent numerical constraints (blocking clauses)**.

## Diamond formulas

SMT encoding of WCET problems leads to **diamond formulas**.

For every state-of-the-art DPLL( $\mathcal{T}$ )-based SMT solver:

- Impossible to get **sufficiently general** blocking clauses

## Diamond formulas

SMT encoding of WCET problems leads to **diamond formulas**.

For every state-of-the-art DPLL( $\mathcal{T}$ )-based SMT solver:

- Impossible to get **sufficiently general** blocking clauses
- The solver will **exhaustively enumerate every paths**  
( $\Rightarrow$  exponential)

## Diamond formulas

SMT encoding of WCET problems leads to **diamond formulas**.

- Impossible to get **sufficiently general** blocking clauses
- The solver will **exhaustively enumerate every paths**  
( $\Rightarrow$  exponential)
- Fully detailed in the paper...

But we can fix that !

# Summary

1 Standard Approach : imprecise

2 Precise BUT Inefficient

3 Precise AND Efficient

## SMT solvers miss “obvious” properties

```
...
if (bi) { /* timing 2 */ } else { /* timing 3 */ }
if (bi) { /* timing 3 */ } else { /* timing 2 */ }
...

```

Human remark: “**obviously**,  $x_i + y_i \leq 5$  for any  $i$ ”

$x_i + y_i \leq 5$  is implied by the original formula

“Normal” SMT solvers **do not invent new atomic predicates**: they can’t learn it...

## SMT solvers miss “obvious” properties

```
...
if (bi) { /* timing 2 */ } else { /* timing 3 */ }
if (bi) { /* timing 3 */ } else { /* timing 2 */ }
...
```

Human remark: “**obviously**,  $x_i + y_i \leq 5$  for any  $i$ ”

$x_i + y_i \leq 5$  is implied by the original formula

“Normal” SMT solvers **do not invent new atomic predicates**: they can’t learn it...

Predicates have to be syntactically present!

If we conjoin these constraints to the SMT formula, the problem is solved instantaneously...

## Our Solution

- Distinguish “portions” in the program.
- Compute upper bound  $B_i$  on WCET for each portion  $i$  (recursive call or rougher bound)
- Conjoin these constraints to the previous SMT formula  
 $c_1 + \dots + c_5 \leq B_1$ ,  $c_6 + \dots + c_{10} \leq B_2$ , etc.
- Do the binary search as before

Solving time from “nonterminating after one night” to “a few seconds”.

# Cuts

The new constraints

- are implied by the original problem (formulas are **equivalent**)
- but not syntactically present in it
- allow the Theory solver to find much more general blocking clauses → prune much larger sets of traces at once

We call them **cuts**, as in Operational Research

# How to choose the portions/cuts ?

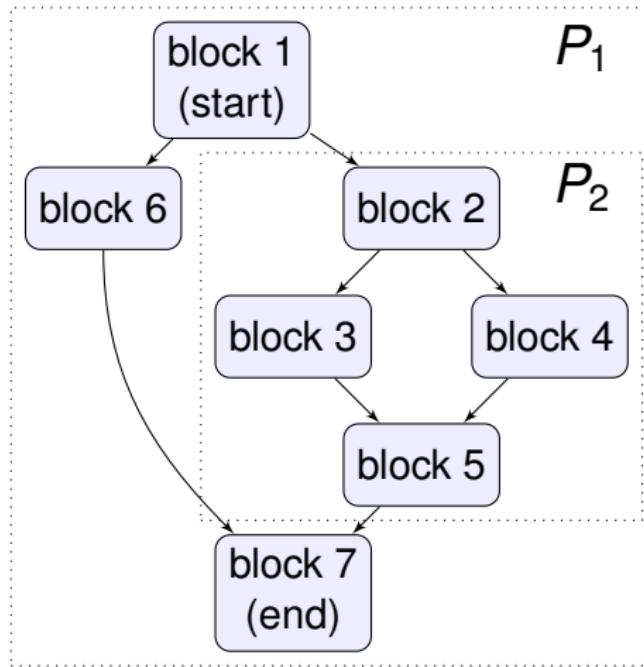

## Syntactic criterion

Simply choose **if-then-else** structures

For  $P_2$ :

$$\begin{aligned} c_2 + c_3 + c_4 + c_5 &\leq \\ c_2 + \max(c_3, c_4) + c_5 \end{aligned}$$

→ was sufficient for our industrial benchmarks

# How to choose the portions/cuts ?

## Semantic criterion

```
...
if (bi) { /* timing 2 */ } else { /* timing 3 */ }
...
/* not contiguous... */
...
if (bi) { /* timing 3 */ } else { /* timing 2 */ }
...
```

- “Slice” the program w.r.t  $b_i$
- Recursively call our WCET procedure
- The obtained WCET gives the upper bound for the portion

# Experiments with ARMv7

OTAWA for Basic Block timings

PAGAI for SMT, see [pagai forge.imag.fr](http://pagai forge.imag.fr), uses Z3 SMT solver

Cuts : only syntactic criterion

Benchmark name	WCET bounds (#cycles)			Analysis time (seconds)		
	ILP IPET	SMT	diff	with cuts	no cuts	#cuts
statemate	3297	3211	2.6%	943.5	$+\infty$	143
nsichneu (1 iteration)	17242	13298	22.7%	6hours	$+\infty$	378
cruise-control	881	873	0.9%	0.1	0.2	13
digital-stopwatch	1012	954	5.7%	0.6	2104.2	53
autopilot	12663	5734	54.7%	1808.8	$+\infty$	498
fly-by-wire	6361	5848	8.0%	10.8	$+\infty$	163
miniflight	17980	14752	18.0%	40.9	$+\infty$	251
tdf	5789	5727	1.0%	13.0	$+\infty$	254

- Malardalen WCET Benchmarks
- Scade designs
- Industrial Code

# Conclusion

- Compute the WCET by replacing ILP by SMT
- WCET estimation is notably improved
- Fully automatic
- Scalability issues addressed using “cuts”

Thank you !

## Advertisement: **PAGAI Static Analyzer** for C/LLVM

- Used by our WCET computation engine
- Detects array out-of-bounds & integer overflows
- Proves assert statements over numerical variables
- Instrument LLVM bitcode with invariants

## Related Work

Use of Symbolic Execution. Differences are:

- Craig Interpolants / blocking clauses + cuts
- SMT solvers select literals out of the program execution order

Other works also make use of SMT, but they do not encode functional semantics

# A Possible Boolean Assignment

Take the satisfying assignment where all the  $b_i$ 's are set to true  
(the  $x_i$ 's = 2 and  $y_i$ 's = 3)

```
if ( $b_1$ ) { /* timing 2 */ } else { /* timing 3 */ }
if ( $b_1$ ) { /* timing 3 */ } else { /* timing 2 */ }
...
if ( $b_n$ ) { /* timing 2 */ } else { /* timing 3 */ }
if ( $b_n$ ) { /* timing 3 */ } else { /* timing 2 */ }
```

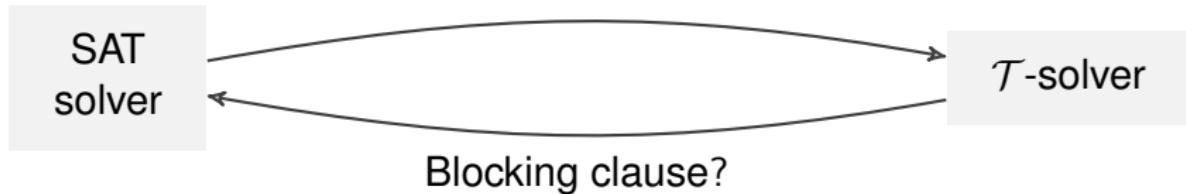

### Theory atoms

$$x_1 \leq 2, \quad x_1 \leq 3, \quad \neg(y_1 \leq 2), \quad y_1 \leq 3$$

⋮

$$x_n \leq 2, \quad x_n \leq 3, \quad \neg(y_n \leq 2), \quad y_n \leq 3$$

$$x_1 + y_1 + \cdots + x_n + y_n > 5n$$

## Theory atoms

$$x_1 \leq 2, \quad x_1 \leq 3, \quad \neg(y_1 \leq 2), \quad y_1 \leq 3$$

⋮

$$x_n \leq 2, \quad x_n \leq 3, \quad \neg(y_n \leq 2), \quad y_n \leq 3$$

$$x_1 + y_1 + \dots + x_n + y_n > 5n$$

## Blocking clause

$$x_1 \leq 2, \quad y_1 \leq 3$$

⋮

$$x_n \leq 2, \quad y_n \leq 3$$

$$x_1 + y_1 + \dots + x_n + y_n > 5n$$

Blocking clauses only cut **one single trace...**

$2^n$  of them.

The solver has to prove them inconsistent **one by one**.

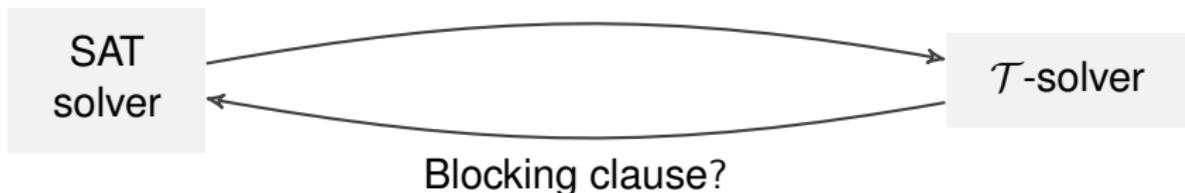

## Theory atoms

$$x_1 \leq 2, \quad x_1 \leq 3, \quad \neg(y_1 \leq 2), \quad y_1 \leq 3, \quad x_1 + y_1 \leq 5$$

 $\vdots$ 

$$x_n \leq 2, \quad x_n \leq 3, \quad \neg(y_n \leq 2), \quad y_n \leq 3, \quad x_n + y_n \leq 5$$

$$x_1 + y_1 + \cdots + x_n + y_n > 5n$$

Cuts all the  $2^n$  traces at once.

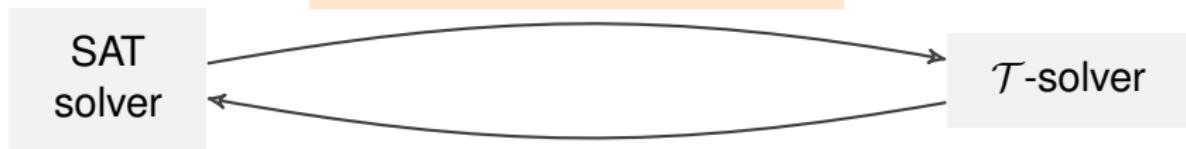

### Theory atoms

$$x_1 \leq 2, \quad x_1 \leq 3, \quad \neg(y_1 \leq 2), \quad y_1 \leq 3, \quad x_1 + y_1 \leq 5$$

⋮

$$x_n \leq 2, \quad x_n \leq 3, \quad \neg(y_n \leq 2), \quad y_n \leq 3, \quad x_n + y_n \leq 5$$

$$x_1 + y_1 + \cdots + x_n + y_n > 5n$$

### Blocking clause

$$x_1 + y_1 \leq 5$$

⋮

$$x_n + y_n \leq 5$$

$$x_1 + y_1 + \cdots + x_n + y_n > 5n$$

Cuts all the  $2^n$  traces at once.
